Tags

By default, text at the start of a line (or after only white space) represents an html tag. Indented tags are nested, creating the tree like structure of html.

```
ul
  li Item A
  li Item B
  li Item C
```

```
<ul>
  <li>Item A</li>
  <li>Item B</li>
  <li>Item C</li>
</ul>
```

Jade also knows which elements are self closing:

```
img
```

```
<img/>
```

Block Expansion

To save space, jade provides an inline syntax for nested tags.

```
a: img
```

```
<a><img/></a>
```

Self Closing Tags

Tags such as `img`, `meta`, `link` and so on are automatically self-closing (unless you use the xml doctype). You can also explicitly self close a tag by simply appending the `/` character. Only do this if you know what you're doing

```
foo/  
foo(bar='baz ')/
```

```
<foo/>  
<foo bar="baz" />
```
